PROFILE

Senior Software Engineer with 5+ years building AI-integrated, full-stack products end to end, and **AI-native by default**: I build production systems with Claude Code and agentic coding workflows as co-developers, not as an add-on. Deep production experience across **LLM integration, MCP tooling, RAG, and agent evaluation** on a Python/FastAPI + React/Next.js stack. I think in systems, how they integrate, how they fail, and how they get reused, and I ship fast, putting working software in front of users.

SKILLS

Python · TypeScript · FastAPI · Flask · React · Next.js · Node.js · AI / LLM Engineering (Claude, Gemini/Vertex, LangGraph, RAG, agent evals, MCP, function calling / tool use, prompt-injection defense) · Qdrant / vector search · Claude Code · Cursor · agentic coding · PostgreSQL · AWS · Docker · CI/CD · OAuth 2.0 / JWT

PROJECTS

VeraCivic (VERA): AI civic-information assistant Next.js 16 · FastAPI · LangGraph · Qdrant · Gemini/Claude for Nigerian citizens

Building and shipping solo (~11k LOC across three services) a production platform that answers questions on Nigerian rights and politics “in plain language, grounded in real law, with sources you can open yourself.”

- Built the core as a **LangGraph ReAct agent** with 6 retrieval tools over a **Qdrant vector store** (FastEmbed/BGE embeddings) spanning an authoritative law corpus (Constitution + Acts) and a rolling news index, multi-provider by design (Gemini 2.5 default, Anthropic Claude swappable via config).
- Engineered **citation-grounded answer generation with a faithfulness eval harness** (claim extraction + verification, ≥ 0.7 grounded-score gate) and substantial eval suites covering in-scope civic questions, out-of-corpus negatives, and adversarial red-team prompts, plus prompt-injection hardening that fences all untrusted web/news content as data.
- Built across three services with **Claude Code as an AI pair-programmer**, running parallel agentic coding workflows for frontend, backend/API, QA, and the eval loop; shipped on FastAPI + Gunicorn with Qdrant on Docker and GitHub Actions CI/CD (staging + prod), and a freemium model (Paystack) in flight.

attest: Evidence-grounded evaluation for AI agent trajectories [View ↗](#) Python · Anthropic · LangGraph

- Open-source framework that scores AI agents by verifying each atomic claim against recorded tool outputs instead of LLM-as-judge, with the verifier kept blind to the agent’s reasoning. Reports faithfulness and tool-use correctness with Wilson 95% confidence intervals, and ships a LangGraph adapter, a Typer CLI, and a library with 32 tests.

Emotion Detection for Autism Support [View ↗](#) TensorFlow/Keras · FastAPI · React · ONNX

- Trained and cross-evaluated CNN classifiers (custom and EfficientNet transfer learning) across FER2013, CK+, and AffectNet, exported to ONNX, and served them behind a FastAPI inference API with a React frontend doing real-time webcam inference.

EMPLOYMENT HISTORY

Fullstack Developer (Contract), Creator Co.

Sept 2025 – Present

Built MCP-powered tooling in Python for creator search and AI campaign-copy generation, and shipped the AI campaign-creation experience to production.

- Built the MCP server and LLM integration powering creator search and AI-driven recommendations in production.

- Owned Chargebee billing reliability: hardened the credit-purchase flow against network loss, built auto-refreshing credit wallets, and resolved subscription edge cases.
- Established Prettier/ESLint, Husky pre-commit hooks, and a CI lint and schema-drift gate, standardising a brand-new codebase.
- Designed and shipped a validated creator-storefront API with reusable validation and standardised error handling, and integrated third-party affiliate networks with stale-while-revalidate caching.

Senior Backend Developer, HerPro App

Jun 2025 – Sept 2025

Worked directly with the founders and early customers, translating their feedback into backend and product changes and iterating until the marketplace was stable enough to go to market.

- Owned the entire backend, a TypeScript and Express service on MongoDB, designing the API architecture, data models, and software structure for a multi-sided marketplace.
- Built secure multi-role authentication with JWT, bcrypt, and OAuth 2.0 social sign-in (Apple and Google), plus KYC identity verification via Smile Identity, Zod request validation, rate limiting, and structured logging.
- Integrated Paystack payment and wallet infrastructure end to end, cutting manual reconciliation by 80%, and shipped a real-time Socket.IO notification system with push notifications, transactional email, geospatial features (Google Maps), and S3 storage.
- Built and owned the admin dashboard in React and TypeScript (TanStack Router and Query, Tailwind, shadcn/ui, Recharts analytics), with real-time updates and Playwright and Vitest test coverage.

Software Engineer (Open Source), Sveltool · OSLabs

Mar 2022 – Mar 2024

- Developed an open-source Chrome DevTools panel on Manifest V3 for real-time debugging of Svelte applications, with component-level segmentation, within the OSLabs tech accelerator.

Software Engineer, SynthAlly

Apr 2023 – Nov 2023

- Built Node.js/Express microservices, improving server performance by 20% through memory tuning, and deployed on AWS (EC2, S3, Lambda) with Docker across staging and production.

Software Engineer, Salesbeat

Apr 2022 – Oct 2022

- Built React and TypeScript applications with GraphQL, and architected a high-performance NoSQL store that cut query response time by 40%.

Software Engineer, Cloudnimi

Mar 2021 – Jan 2022

- Engineered Node.js APIs that cut data latency by 50%, improving response times across the plugin platform's client and core database interactions.

EDUCATION

M.Sc., Software Engineering

Mar 2025

Euclea Business School, France
